The graph displays the mortality rate in the United States over a 50-year period. The y-axis represents the number of deaths per 100,000 people, ranging from 0 to 20. The x-axis represents the years from 1950 to 2000. The data shows a high mortality rate in the early 1950s (around 18 deaths per 100,000), which then drops sharply to around 10 by 1955. From 1955 to 1965, the rate fluctuates between 10 and 12. After 1965, the rate generally declines, reaching a low of about 8 in the mid-1970s. It then rises slightly to around 10 by 1980 and remains relatively stable until the late 1990s, when it begins to rise again, reaching approximately 12 by 2000.
